# EP.PRINTiD

P1 Profesional Add-on Module

FULLY INTEGRATION YOUR
ACCESS CARD PRINTING
SOLUTION

EP.PrintID is fully integrated with Platform1 Server, and it increase the productivity, accuracy and precision when processing the access card printing for the Platform1 users.

The EP.PRINTID Module only available for Fargo Printer at the moments.

Feature Highlight

Collapsible Panel view
To allow user to minimise/hide unused "panel" so that user can concentrate on vital tasks.
Simply hide/minimise unused panel so that user can concentrate on more important task more quickly and easily.

2-point cropping feature
Instead of conventional "mouse drag" cropping style, a 2-point cropping method was introduced.
A 2point is simply "coordinates" of top (top of head) and bottom (below of chin) of a person facial portrait.
A cropping box will be automatically generated based on the center point (mainly around the nose area).

This will provide a more consistent cropping ratio comparing with a mouse drag pattern where the consistency of the cropping box will be variance and difficult to judge.

Customizable template design
User is able to design multiple template design with the drag and drop features of label fields or picture boxes.

Priority Print
While printing process will be sequential from the top of the print list, print list item can be moved to the top of the list to get print first. This is handy when more important list can be set as priority to get printed first.

Single/Batch print
Printing process can in single card print or batch, multiple card print in 1 time go.

Firebird database support
EP.PrintID current supports Firebird databases and will be open to more database type in the Private and Confidential.

Single/double sided* print
Print job can be set as a single sided, in which only one face of the card will be printed, or double sided, where both face of the card will be printed.

*Double sided print will be depending on printer models where a "flipper" is required to auto flip the card when printing double sided. Else printer will only print on the single face of the card and the second face will be printed on the second card available in this case.

UV image/text printing (Printer specific)
UV image/text printing is a special print which requires a UV light to view/see the content.
Image/text printed are invisible to our naked eye.

Predefined/User defined printing field
User details are fetch from Platform1 user database. There are predefined field(s) in Platform1 user database which a "map" to PrintID and also user defined field are available for users incase those predefined field does not meet the printing requirements.

Drawing Shape Creation
In template design, user will have the ability to create shapes like rectangle, eclipse or line to meet user's printing template requirement.

Multiple template print
Multiple template design in a single print list is possible to print different templates. This will ease user from printing different template in different print jobs. Now user can combine different templates in 1 single print list.

Selectable Print list
User can pick/select those to print from the print list instead of printing the entire list. This give user a better control to select those to print first.
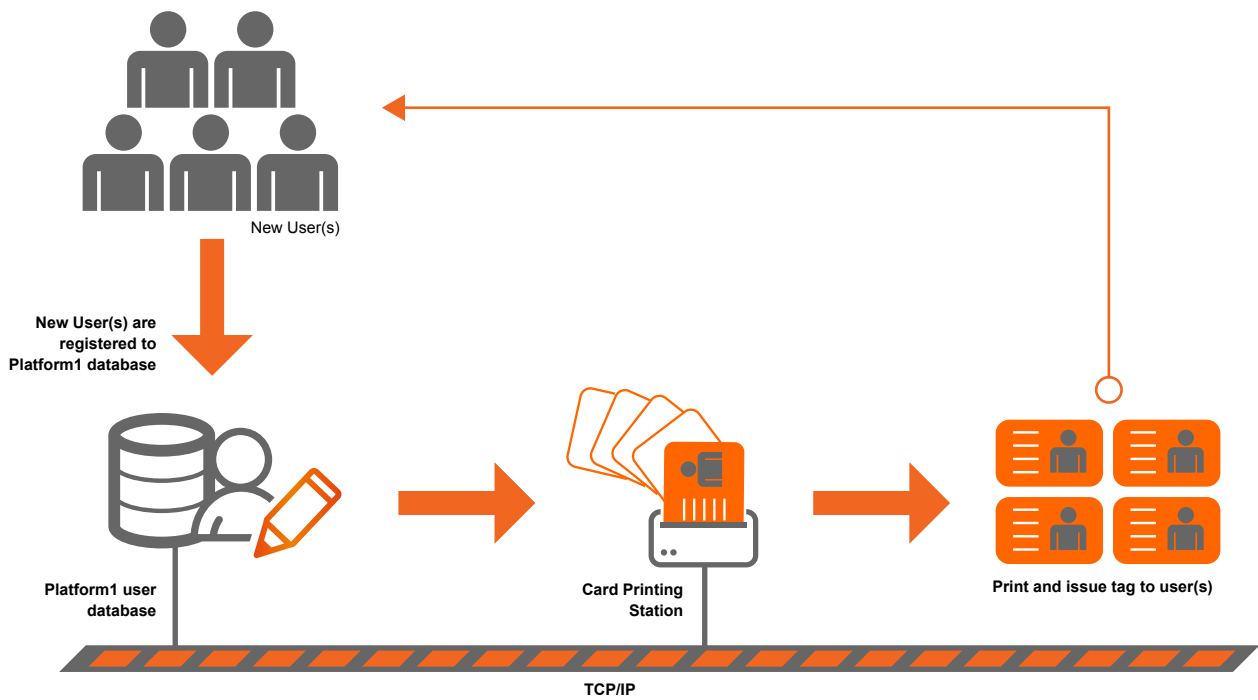

Stored Print list
Print list created will be saved. Print list will still be available when the system restart and no need for user to "readd" them to the print list.

Print Job Report
User are able to generate report for print jobs carried out to view statistics or for audit purposes.

System Architecture

New User(s)

New User(s) are registered to Platform1 database

Platform1 user database

Card Printing Station

Print and issue tag to user(s)

TCP/IP

*Remark : EP.PRINTID Module only available for Fargo Printers at the moment.

Ordering Information
EP.PRINTID   Entrypass Access Card Printing System (Fargo Printers).
